

## ABSTRACT

5           Methods, systems, and apparatus combine simulation and  
emulation debugging in a single debugging session. A debugging  
session is established to debug instructions. During that session a  
number of the instructions can be processed in a simulation mode or  
an emulation mode. Processing can be switched between the modes  
during the session. Coherency is maintained between both modes of  
10           operation during the session.
